<ul style="list-style-type: none"> • Gabriel Delgado Calvo-Flores • Eduardo Ortega Bernaldo de Quirós • Jesús Párraga Martínez • Juan Manuel Martín García 		Dpto. Pedology and Agricultural Chemistry, first floor, Faculty of Pharmacy. Offices: 181, 184, 185 and 186. E-mail: gdelgado@ugr.es , eortega@ugr.es , jparraga@ugr.es , jmmartingarcia@ugr.es ,							
DEGREE WITHIN WHICH THE SUBJECT IS TAUGHT									
Degree in Science and Food Technology									
PREREQUISITES and/or RECOMMENDATIONS (if necessary)									
Have completed the basic subjects of the degree									
BRIEF ACCOUNT OF THE SUBJECT PROGRAMME (ACCORDING TO THE DEGREE)									
- The agricultural soil: morphology, constituents, natural fertility, soil quality/soil health. Artificial soils. - Degradation, correction and improvement of agricultural soils. - The essential elements: macro and micronutrients. - Fertilization: inorganic and organic. Biofortification. - Pesticides. - Agricultural models. - Soils, food and human health.									
GENERAL AND PARTICULAR ABILITIES									
The Agricultural Chemistry ensures the acquisition of all general abilities, included in the agreement of the Commission Andalusian Commission for the Degree in Food Science and Technology (30122009) and in the Degree Project (pages 11 and 12).									
<u>Particular abilities:</u>									
- Know the models of food production, composition and physical, physico-chemical and chemical properties to									

determine its nutritional value and functionality.

- Know, understand and apply the classical methodology and new technological processes aimed to improve the production and processing of food.
- Analyze biological, chemical and physical hazards in the food chain in order to protect public health.
- Develop protocols for environmental management and quality control in food industry.
- Know and set nutritional guidelines and design food to encourage consumption and healthy eating.
- Inform, train and advise legal, scientific and technical, to the public administration, the food industry and consumers, to design strategies of intervention and training in the field of science and technology of foods
- Put into practice the principles and methodologies that define the professional profile of scientist and technologist of food, showing in an integrated way the acquisition of skills and competencies that contemplates the degree.

OBJECTIVES (EXPRESSED IN TERMS OF EXPECTED RESULTS OF THE TEACHING PROGRAMME)

We intend that at the end of the matter the student has acquired knowledge and skills on the following aspects:

- The agricultural soil: its morphology, components, properties, natural fertility, and quality.
- Artificial soils, both solids and liquids (hydroponic).
- Degradation, correction and improvement of agricultural soils.
- Essential elements: macro and micronutrients and their status in the soil-plant system.
- Inorganic and Organic fertilization and food Biofortification.
- Pesticides: their advantages and risks.
- Agricultural models and its possible relationship with the quality of food and sustainability.
- The relationships between soil, food and human health.
- Sampling of agricultural soils.
- Analysis of nutrients in the soil and different types of fertilizers
- Calculations of corrections and improvements of agricultural soils

These knowledge contribute to the education of the student in the three basic pillars of nutrition:

1. The preparation and preservation of food
2. The quality and food safety
3. The binomial nutrition-health

DETAILED SUBJECT SYLLABUS

THEORETICAL ISSUES:

Lesson 1. The Agricultural Chemistry and the Agricultural soil

Lesson 2. Components of the agricultural soils

Lesson 3. The natural fertility of agricultural soils

Lesson 4. The artificial substrates for the crop

Lesson 5. The Quality of the agricultural soil

Lesson 6. Degradation of agricultural soils

Lesson 7. Correction and improvement of agricultural soils

Lesson 8. The Essential Elements in the soil-plant-foods system: General Information

Lesson 9. The essential elements in the soil-plant-foods system: macronutrients

Lesson 10. The essential elements in the soil-plant-foods system: micronutrients

Lesson 11. Fertilization: Laws of the Fertilization, Inorganic Fertilization

Lesson 12. Organic fertilizers

Lesson 13. Biofortification

Lesson 14. The pesticides

Lesson 15. Agricultural models

Lesson 16. Soils, foods and human health

PRACTICE ISSUES:

Seminarios

- Los suelos y la alimentación bajo la perspectiva de un cambio climático
- El futuro de la humanidad frente a la escasez de suelos y agua para la agricultura
- Los conceptos de seguridad alimentaria en el marco de una agricultura sostenible
La Vega de Granada: agricultura y alimentos a lo largo de la Historia

Field practices

-Description and sampling of the topsoil of agricultural soils for laboratory practices

Laboratory practices

- Preparation of samples of arable layer and layer of roots of agricultural soils for analysis in the laboratory
- Determination of soil bulk density
- Determination of available potassium in the soils
- Determination of available phosphorous in the soils
- Determination of the active lime in soils
- Determination of assimilable heavy metals and micronutrients

Seminaries

- Soils and food under the perspective of climate change
- The future of humanity under the perspective of a shortage of land and water for agriculture
- The concepts of food security within the framework of a sustainable agriculture

-The Vega of Granada: soil, agriculture and foods along the History
